Photo documentation

Individually:

1. Find the document titled “Data Description: Photo Documentation of the North Campus Open Space Restoration Project”.
2. Read about the photo documentation process.
3. Find 1-3 photo points relevant to your study using the ArcGIS web map.

As a group:

4. Discuss which photo point to focus on based on its relevance to your study question or context.
5. Decide on a photo point.
6. Find 2-4 photos at that photo point to represent seasonal changes within a water year.
7. In the table below, fill in the information for each photo at the photo point.

Table

Photo point number	Date of photo	Season	Direction of photo	Link to photo
-----------------------	---------------	--------	-----------------------	---------------

| (14) | April 2025 | Spring | W | <https://ucsb.app.box.com/s/e2r7vg2d0rmfj0aa60m77tlba6bzc035/file/20556654709> |

8. Describe in 5-7 sentences total:

- which water year you chose to examine
- how that water year is relevant to your study
- which photo point you chose to examine
- how that photo point is relevant to your study
- what changes you see in vegetation, animals, environmental characteristics from the photos you chose.

Poster

Title: Evaluating Sheep Grazing as a Strategy for Restoring the North Campus Open Space (NCOS) Grasslands

Authors: Abby Nestor Faculty Advisors: Dr. Lisa Stratton and Dr. Carla D'Antonio

Year published: 2025

Permalink: [<https://escholarship.org/uc/item/9jp6r7zs>]

Dataset used (likely): self procured experimental datasets – greenhouse seed viability experiment, field biomass experiment

The dry biomass of native *Stipa pulchra* and *Deinandra fasciculata* and invasive species *Medicago polymorpha*, and *Melilotus indicus*, experienced a decrease following sheep grazing. The annual invasive grass *Festuca perrenis* increased its dry biomass following grazing. Additionally, T-test results suggest that the differences between the mean dry weights of the pre-grazing and post-grazing biomass samples of *F. perennis*, *M. polymorpha*, and *S. pulchra* are not statistically significant. Finally, The abundance of *M. polymorpha* individuals, very few *F. perennis* individuals, and complete lack of *S. pulchra*, *D. fasciculata*, and *M. indicus* individuals, suggests that the seeds of *M. polymorpha* are relatively durable and have high germination viability after passing through the sheep.

These findings show that intentional disturbance can affect plant communities in species specific ways, which connects to my question of how native and non native percent cover changes before and after disturbance at NCOS. The findings relate most closely to Figure 1 which compares native vs. non-native cover over time, and to Figure 2, which shows percent cover changes in key species after the 2023 cultural burn. The poster's findings suggest that disturbance does not produce one uniform response, which is important for evaluating whether disturbance is meeting restoration goals or favoring invasive cover.

Annotated bibliography

Background

You can find peer-reviewed articles by searching on Google Scholar, which is a large database of research papers, posters, and other materials.

Note: while it may be tempting to use AI to provide a list of papers for you, you should *not* be using AI for any component of this activity. You'll accomplish the objective of articulating the connection between your study and other study systems/questions by completing the difficult task of sifting through papers that may not be relevant to you before finding one that is.

Additionally, you can test out inserting citations in Quarto. See [this resource to insert a citation in a .qmd](#).

Directions

Individually:

1. Search Google Scholar for papers that might be relevant to your study. One recommendation for how to start: search for whatever your focal variables may be + “wetland restoration” (for example, “bird abundance wetland restoration”, “water salinity wetland restoration”, “aquatic invertebrate wetland restoration”).
2. Find 4-5 papers that might be relevant based on title and what shows up in the search.
3. Read the abstracts of those 4-5 papers.
4. Decide which - if any - are actually relevant to your project. Make a note of these papers. Note that a paper may be relevant in that it shares a) taxonomic groups, b) geographic regions, c) research questions, d) research methodology - there are lots of ways that existing research can be tied into your project.
5. If step 4 did not yield any relevant papers, repeat steps 2-4.
6. Search for papers until you have 4 relevant papers per person (12 total for a 3 person group).

As a group:

7. Share the papers you found, discussing the main points of the paper and how they are relevant to your project.
8. Fill in the template for an annotated bibliography below.
9. In the “Main findings” or “Relevance to study” sections, insert a citation for the paper.

Paper 1

Title:

Authors:

Main findings (2-4 sentences):
